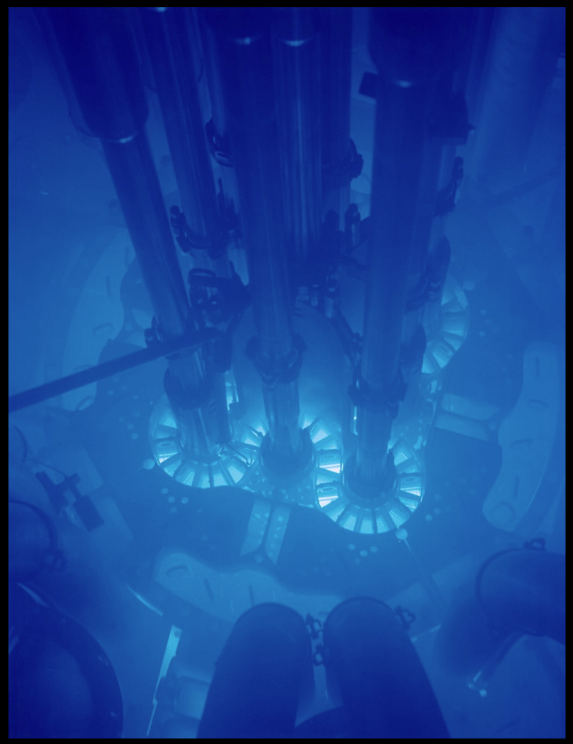
Astrophysical Neutrinos and New Physics with Water Cherenokov detectors



Kenny, Chun Yu Ng (吳震宇)
Weizmann Institute of Science

Neutrinos Astro-particle physics

Astro ---------- Particle

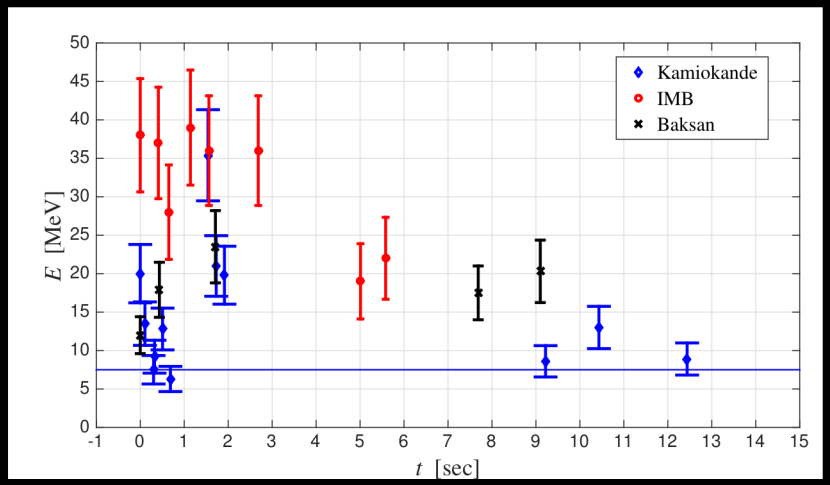
- Reveal concealed astrophysical sites
  - Solar, Supernova 
  - AGN
- Ideal messenger
- Cosmic hadron accelerator
  - 100 year CR problem

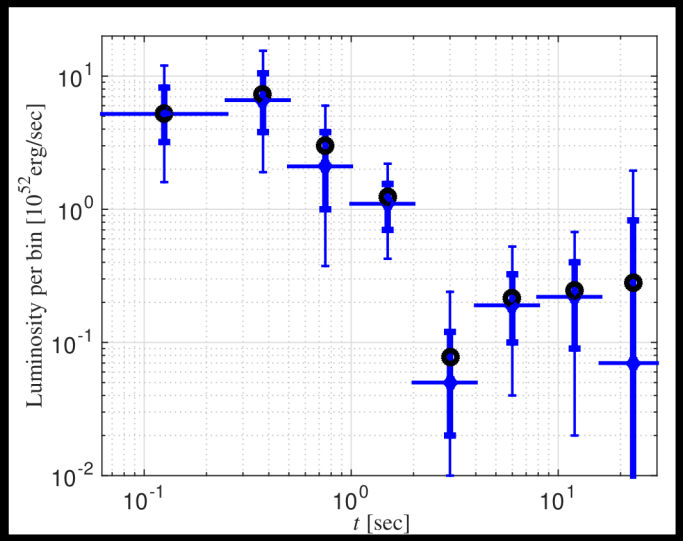
- Neutrino mass 
  - Dirac mass, why so small? -> Sterile neutrino!
  - Majorana mass?
  - Both?
- New physics portals?
  - Dark matter
  - Secret interactions

Supernova Neutrinos

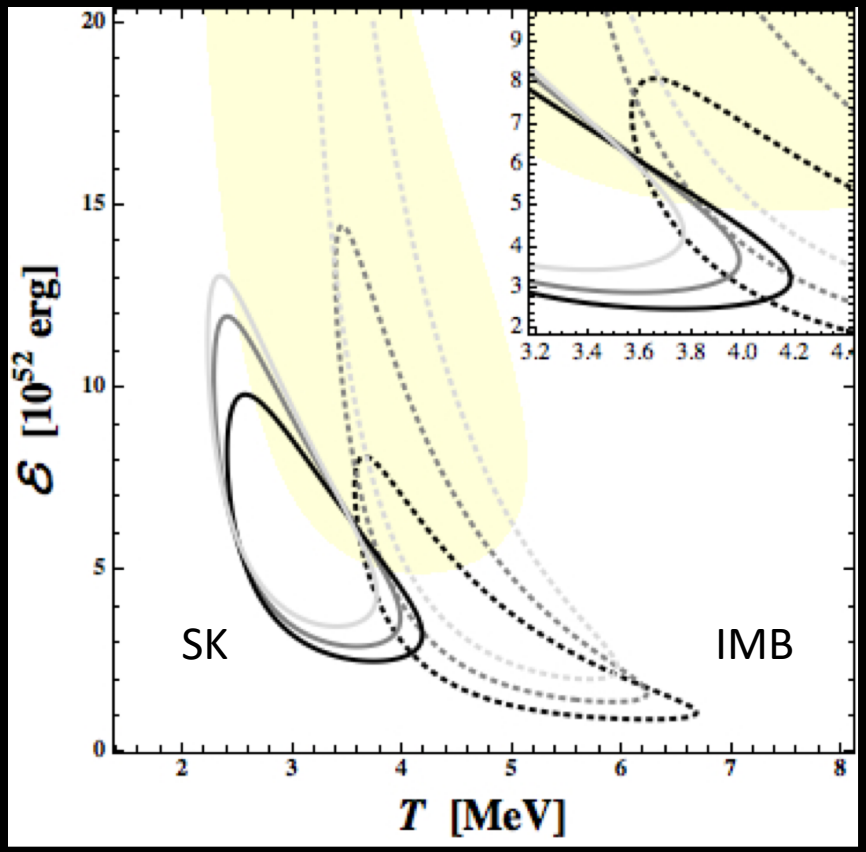
Galactic Supernova

- SN1987A





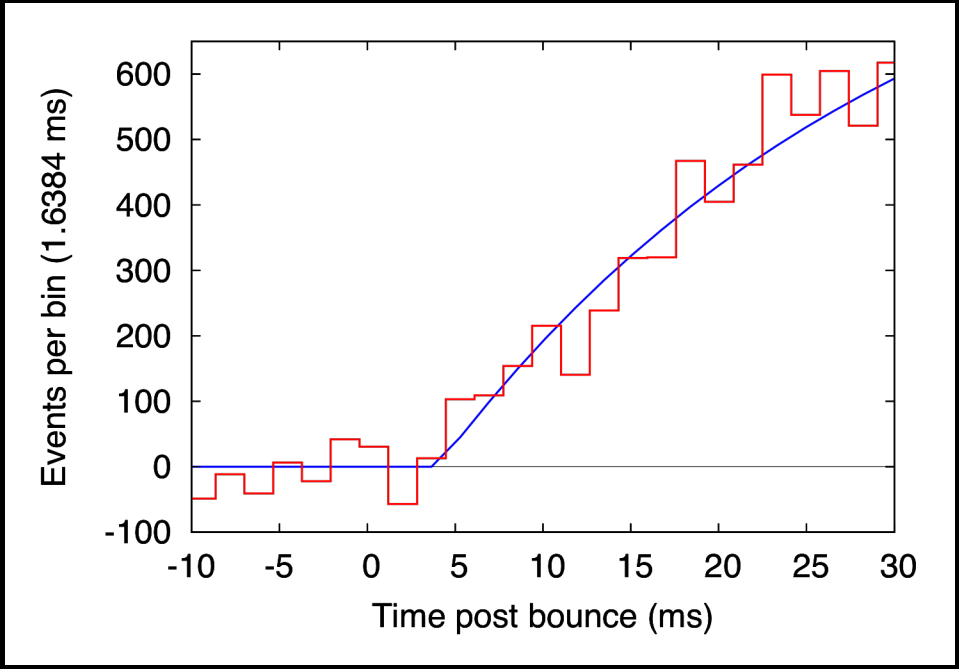
Blum Kushnir 2016



Vissani 2015

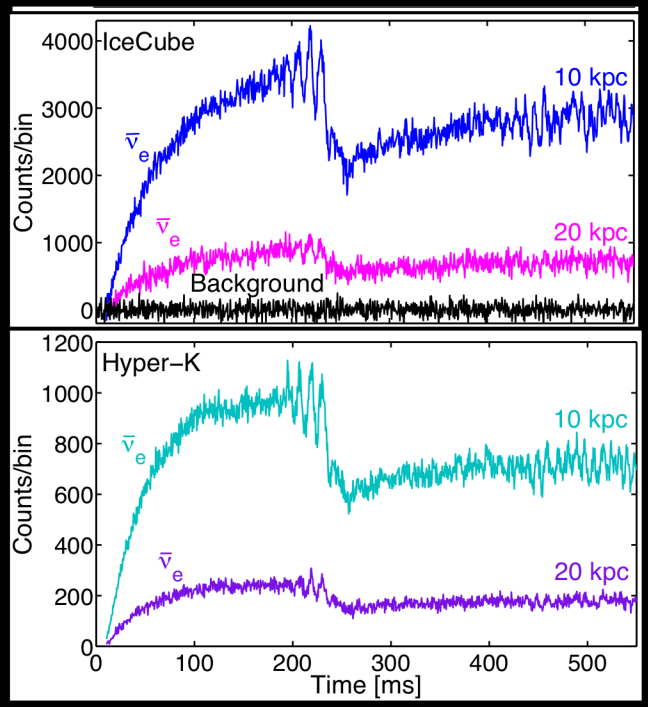
Galactic Supernova

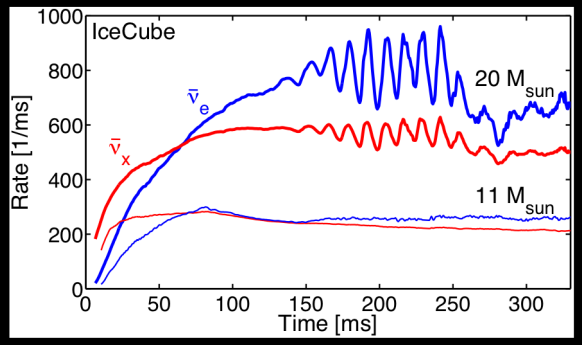
- IceCube



Halzen Raffelt 2009

Tamborra+2013

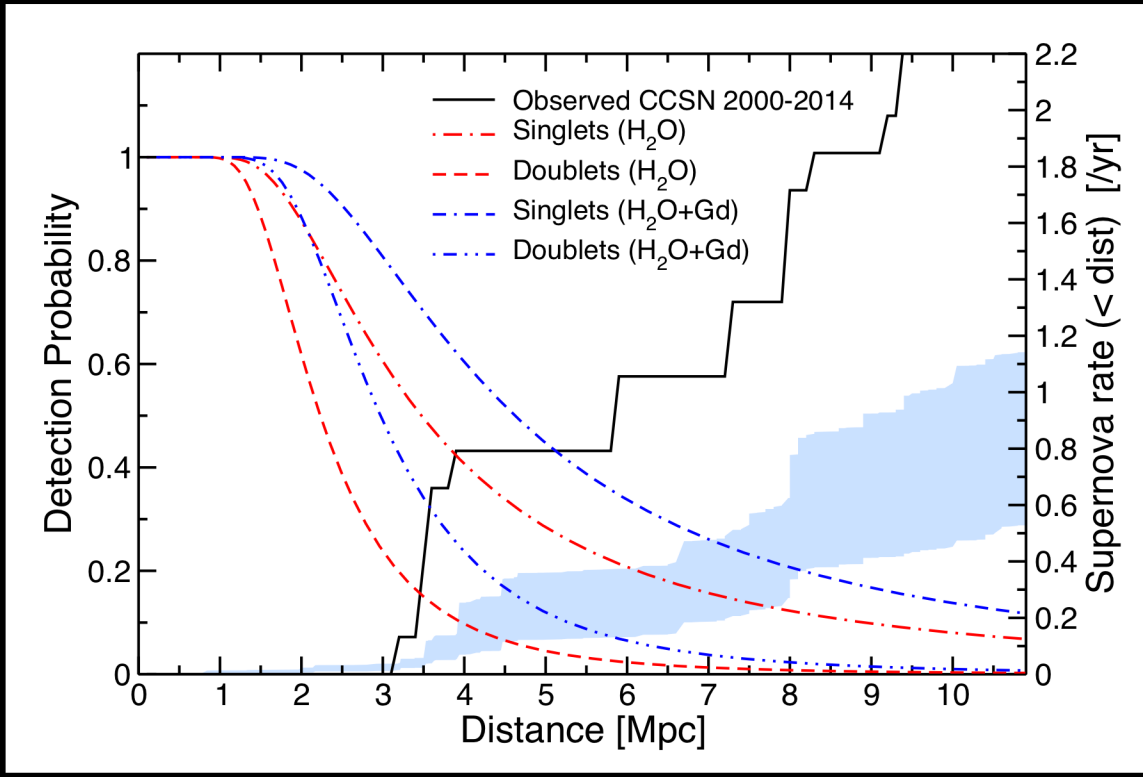




- Bounce time ± 3.5ms -> GW

Nearby Supernova

- Can we see nearby supernova?
  - Local Overdensity
- 1/year <6Mpc
- Singles (+ optical)
  - 30%
- 10 years
  - 1- P(no det.) > 97%!

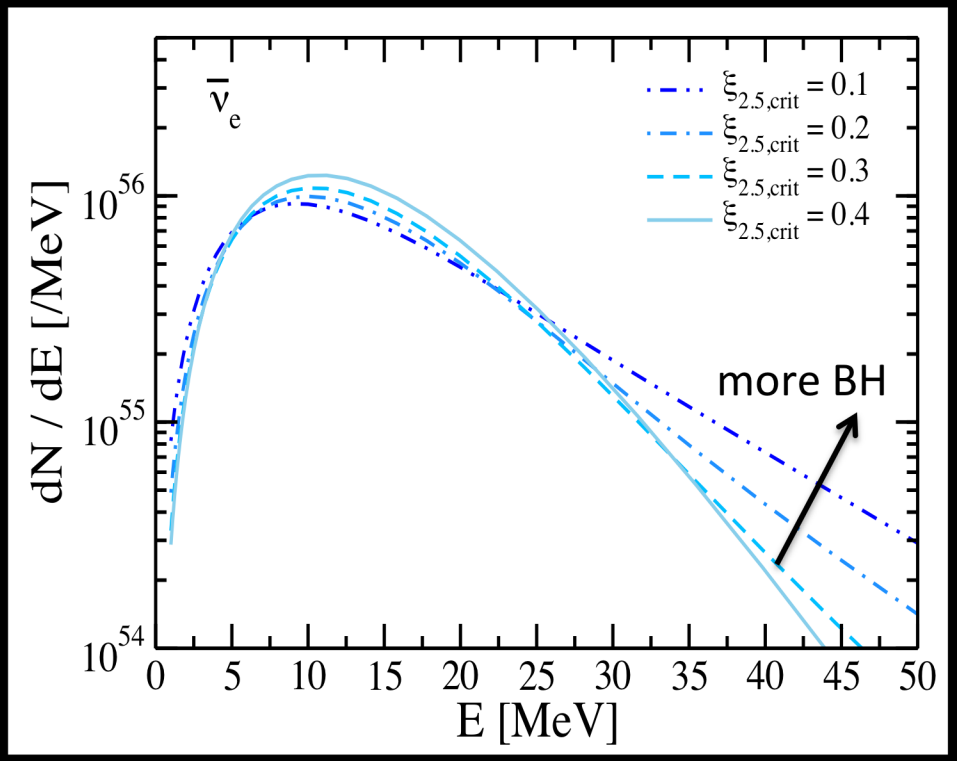


Nakamura et al 2016

Diffuse supernova neutrino background

Average neutrino emission

- Use >100 simulations to characterize progenitor dependence of neutrinos
- Include collapse to black holes, characterized by critical compactness

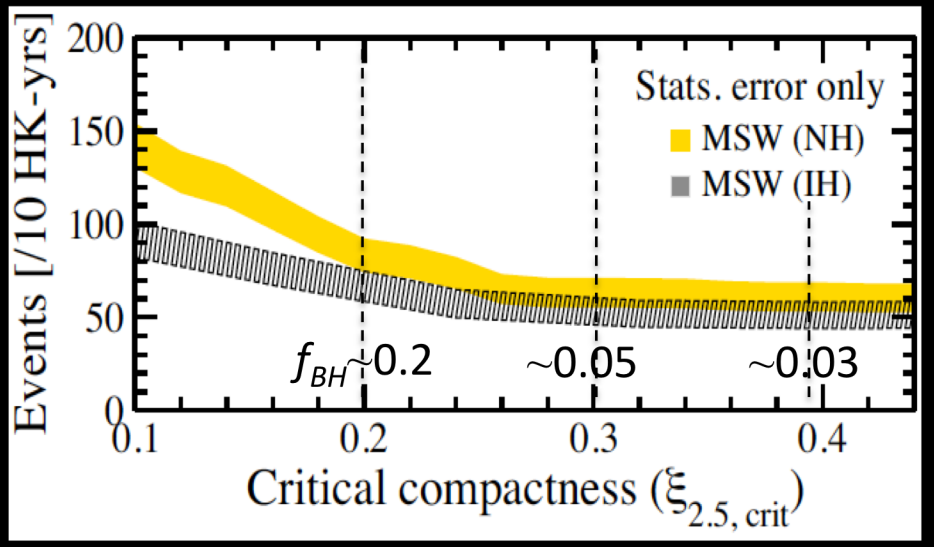


reviews by Beacom (2010), Lunardini (2010)

Event rate predictions

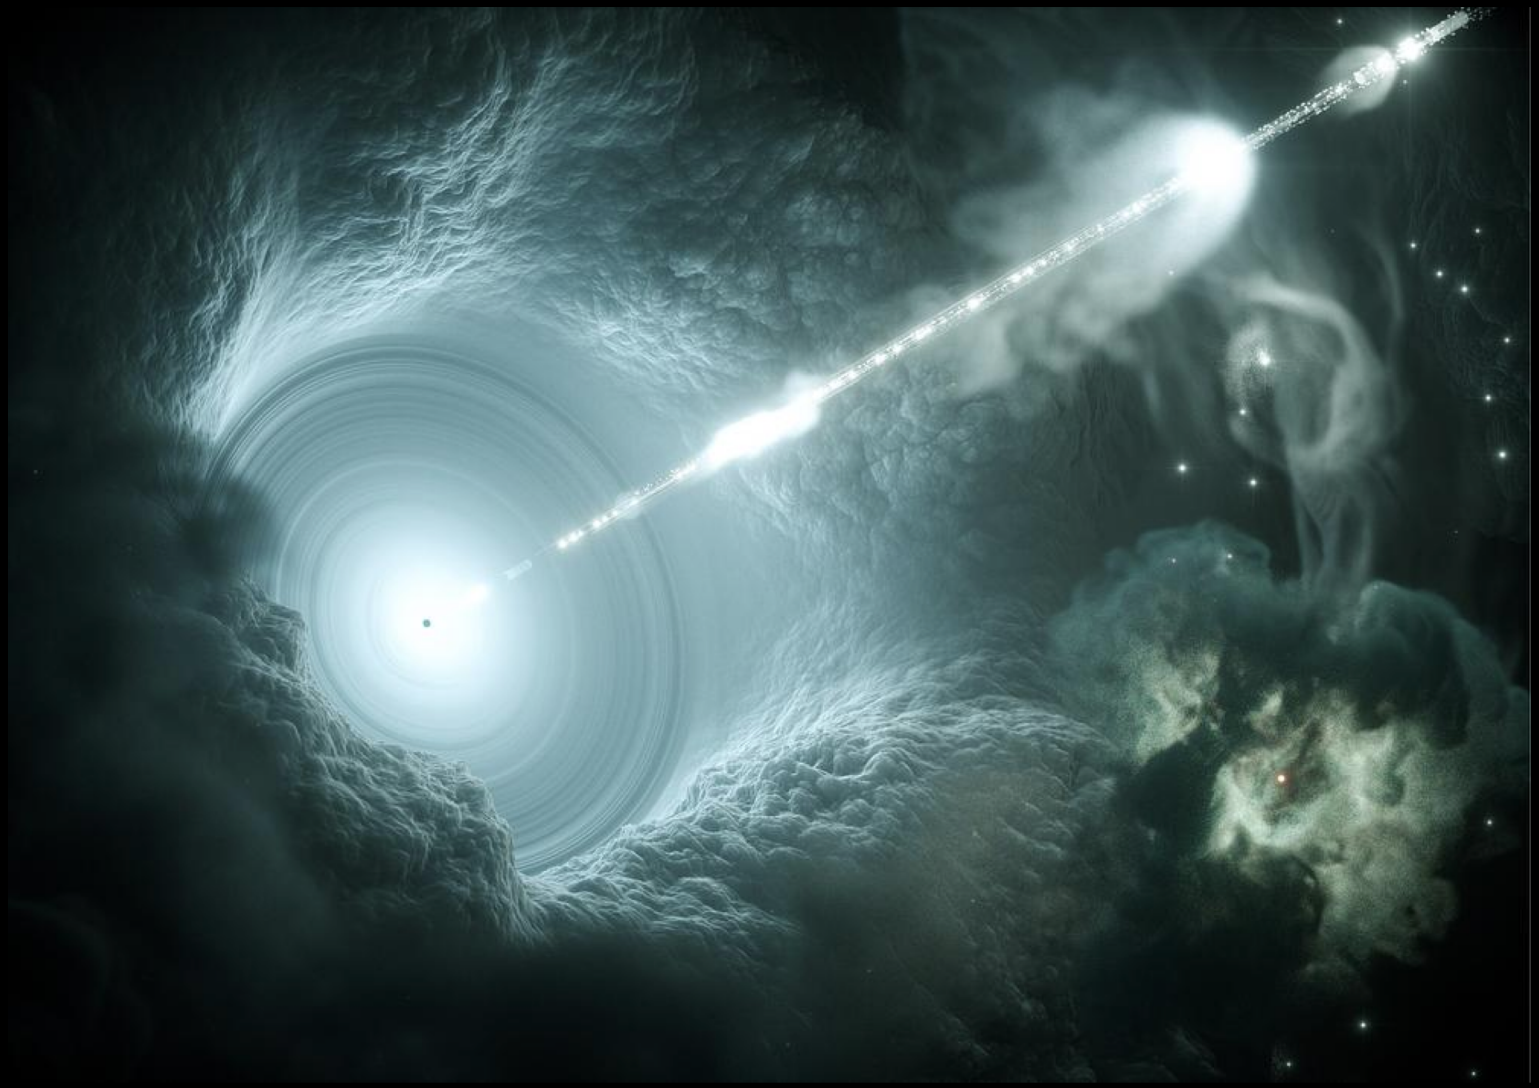
Hyper-K sensitive to small compactness ($\xi_{2.5} < 0.2$, or $f_{BH} > 0.2$)

Spectrum	SK + Gd (>10MeV) [/yr]
4 MeV	1.8 +/- 0.5
4 MeV+BH	< 2.5
SN1987A	1.7 +/- 0.5



Horiuchi et al (2018); see also Lunardini (2009), Lien et al (2010), Moller et al (2018)

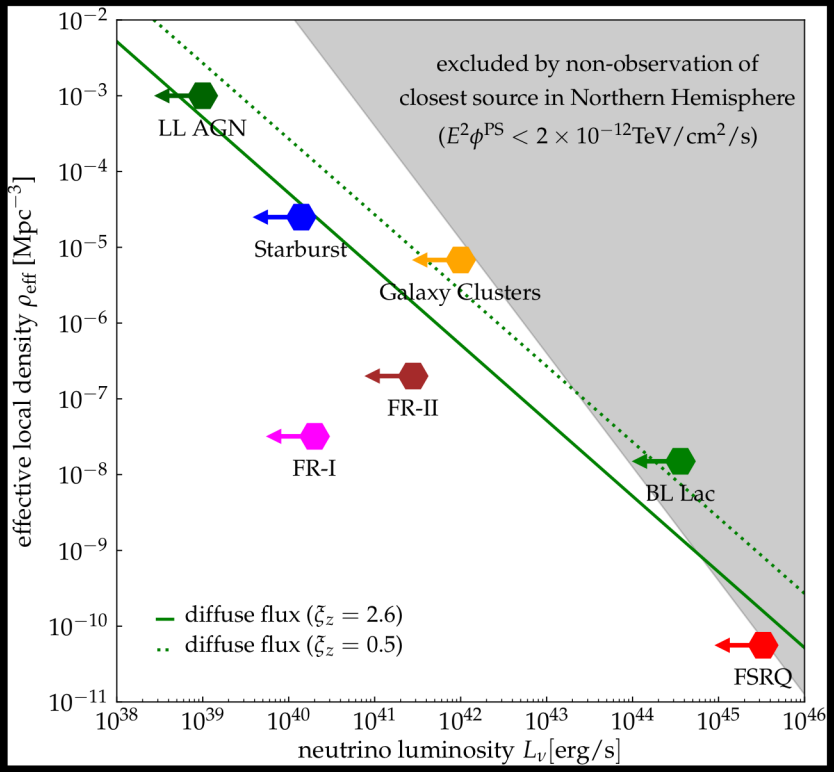
Astrophysical Neutrinos



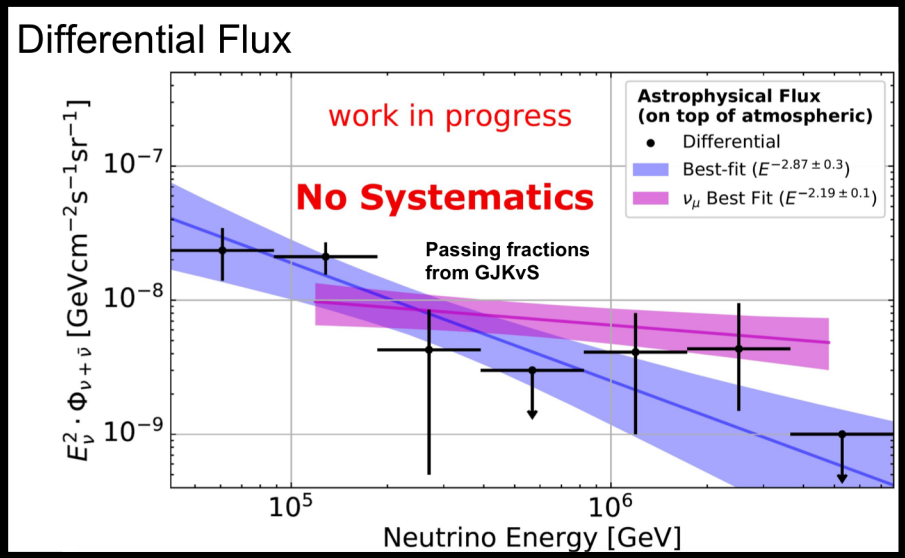
DESY: science communication lab

Diffuse Astrophysical Neutrinos

- IceCube HESE and ν_μ
- $E^{-2.2}$ vs $E^{-2.9}$?
- Two components?

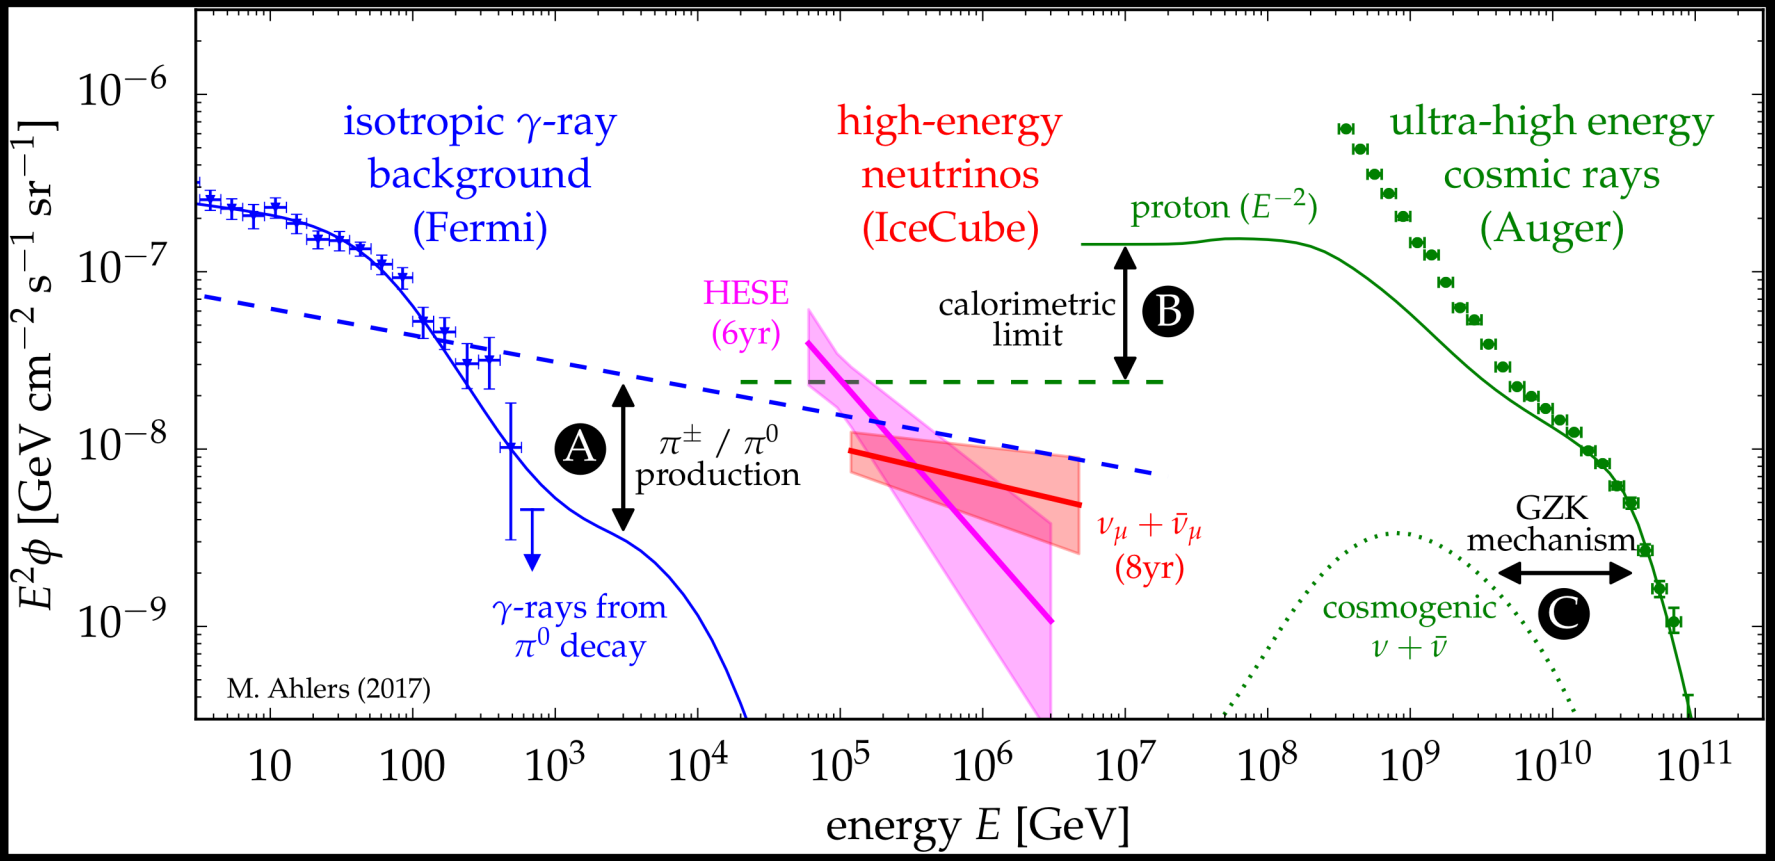


Schneider TeVPA2018



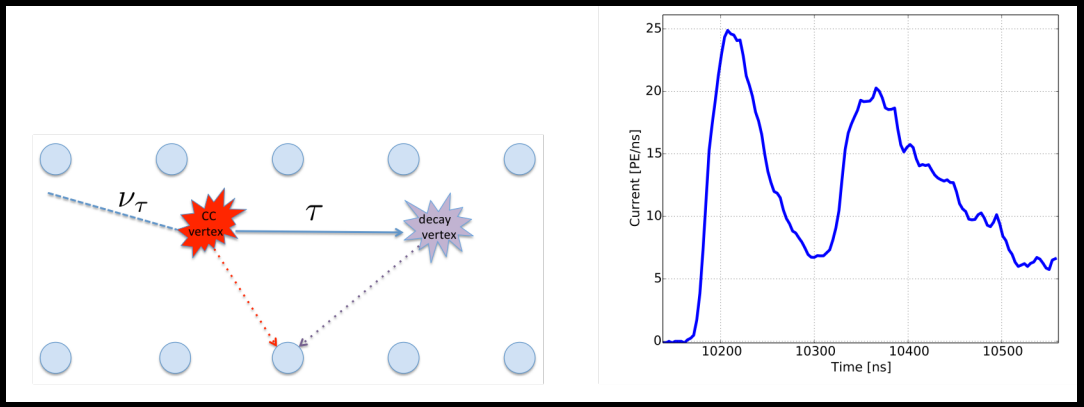
- Source cannot be rare and bright
- Or maybe hidden?

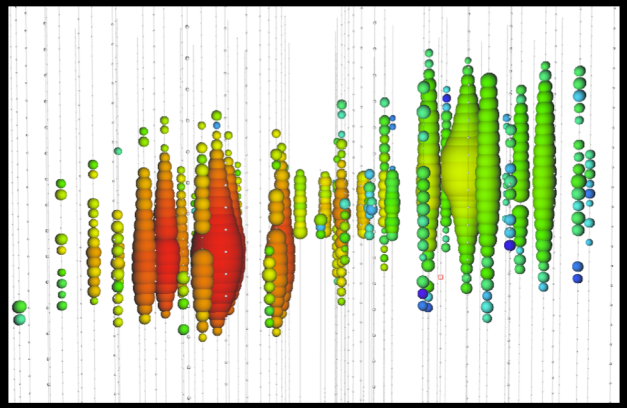
Multi-messenger Connection



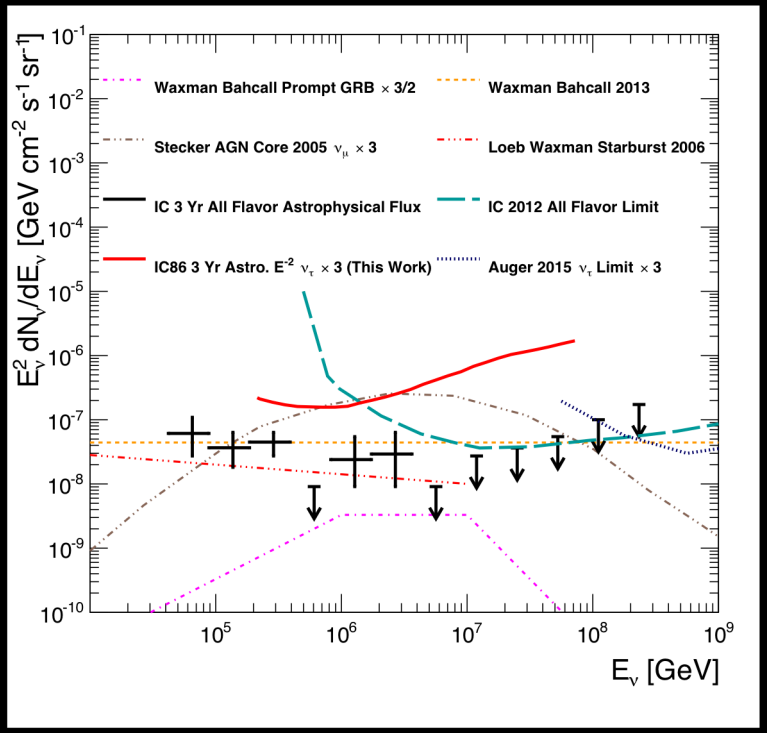
Ahlers, Halzen 2018

Where are the Taus?





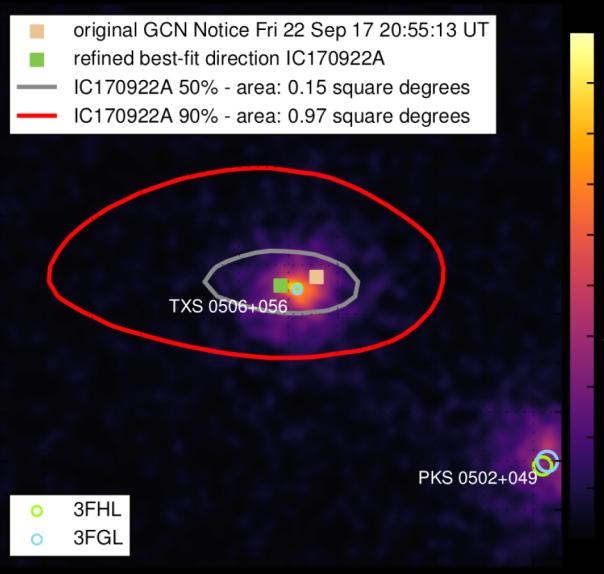
- Double Bang
- Double Pulse



IceCube 2015
3 years

Point source astrophysical Neutrinos

- Era of multimessenger astronomy with TXS events
-

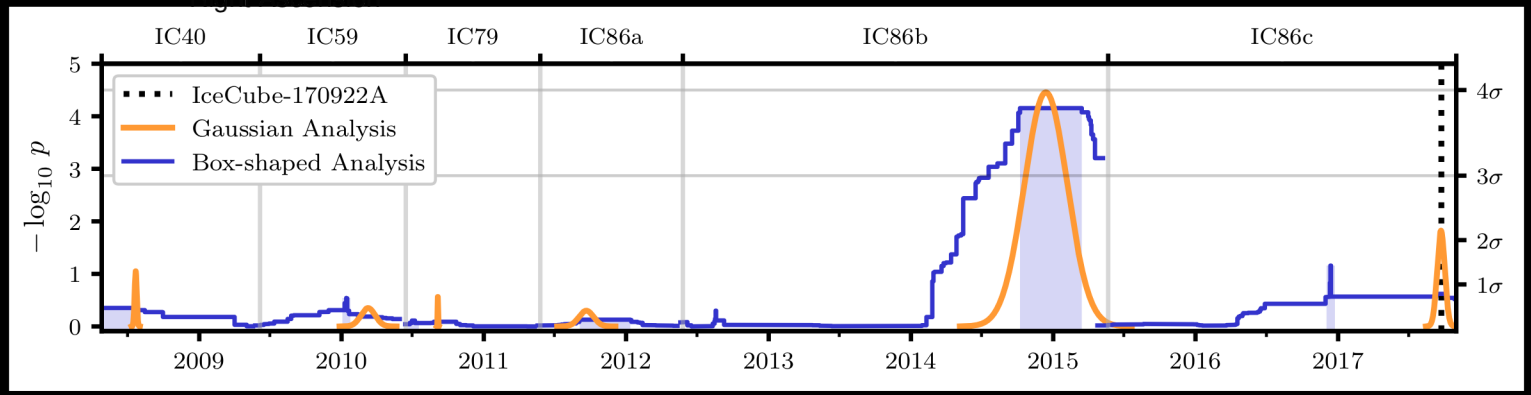


Blazar as a hadronic accelerator!

Association ~3 sigma

Neutrino flare ~3.5 sigma

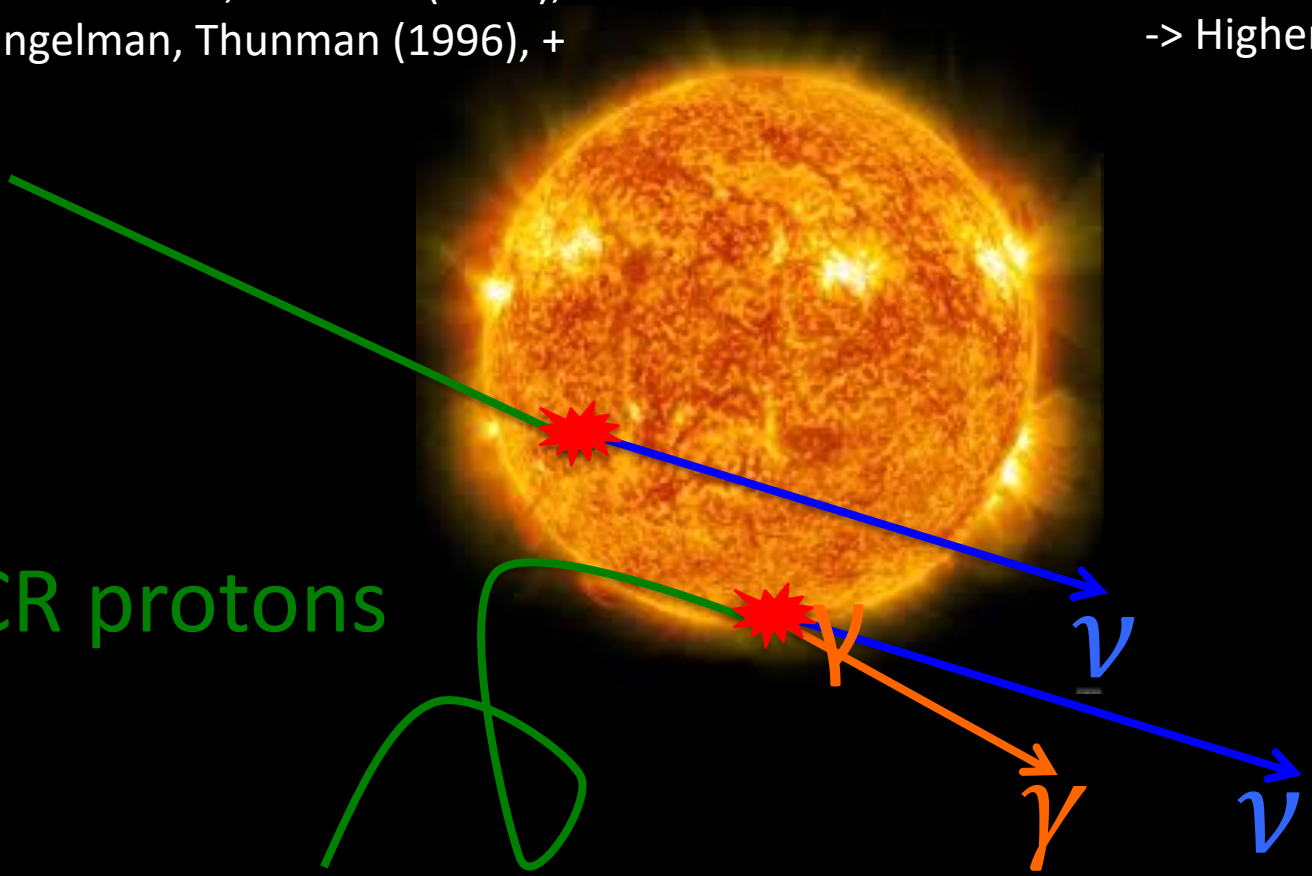
Need more of these!

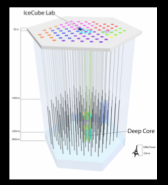


Sun – Cosmic-ray beam dump

Seckel, Stanev, Gaisser (1991),
Moskalenko, Karakula (1993),
Ingelman, Thunman (1996), +

Low density atmosphere
-> long interaction length
-> more decays
-> Higher flux, higher energy





Neutrino Flux

- Showers: $\nu_{e,\tau}CC, \nu_X NC$
- Tracks: $\nu_\mu CC$
- $\nu_\mu CC$ for directionality
  - kinematic angle
- Above ~3 TeV, greater than Earth ATM background
- Unclear how solar magnetic fields change the prediction

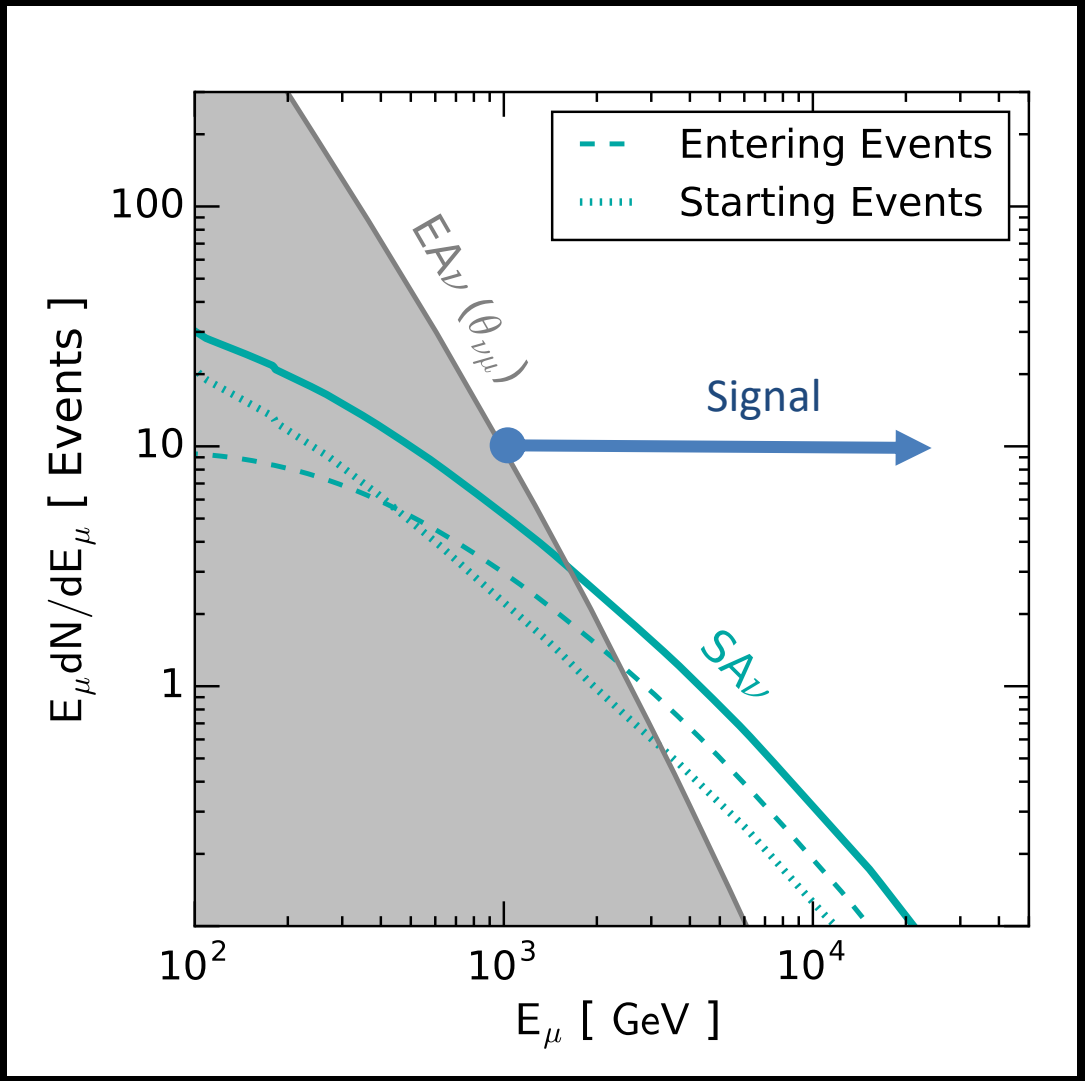
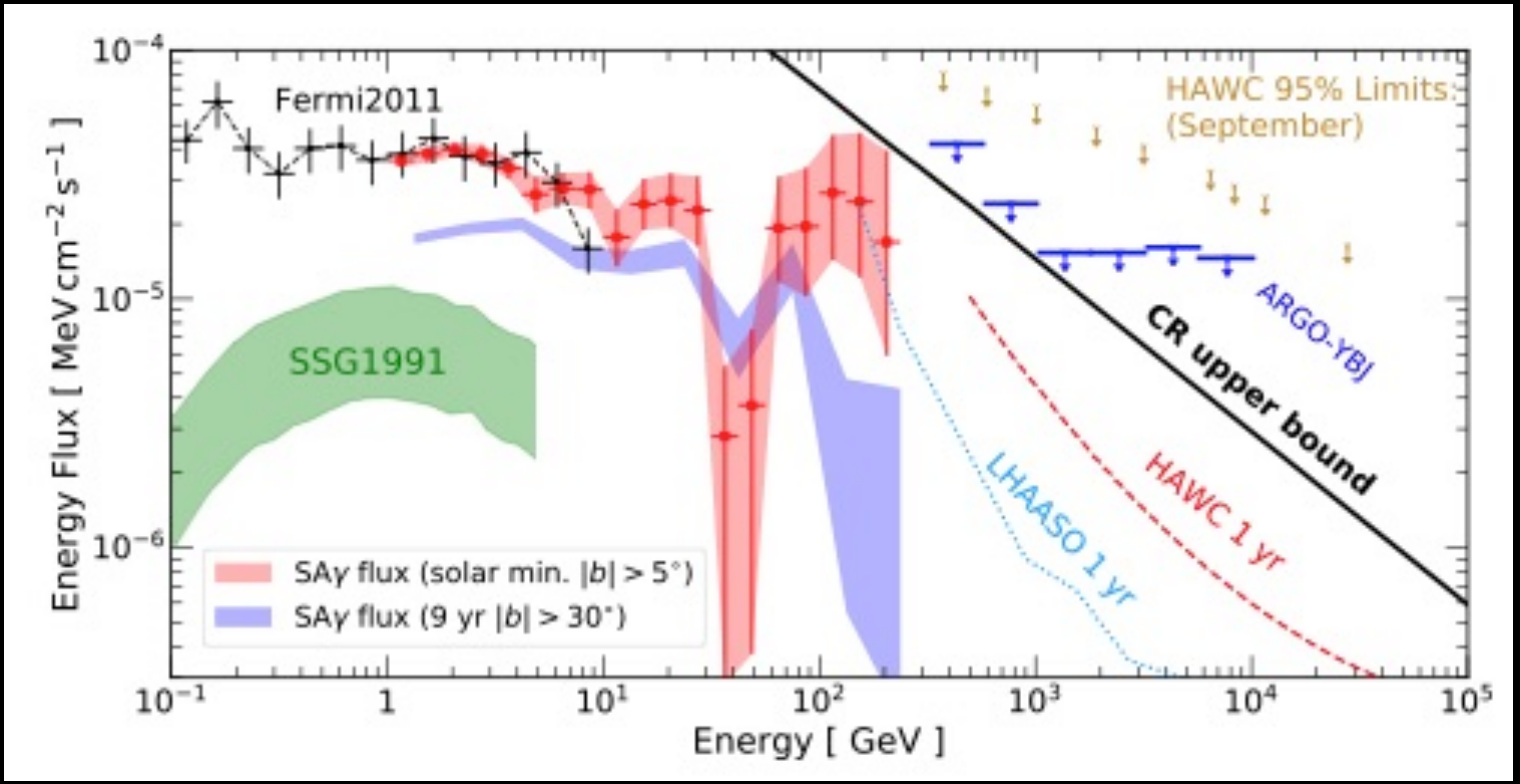
Neutrino energy

SAν as a Signal

- Muon (>1TeV)
  - Energy resolution via energy loss
- ~ 5 signal events in 10 years (4 bkg)
- ~~1st~~ Another high-energy neutrino source?
- Common source for IceCube + KM3NeT



Solar Atmospheric gamma rays



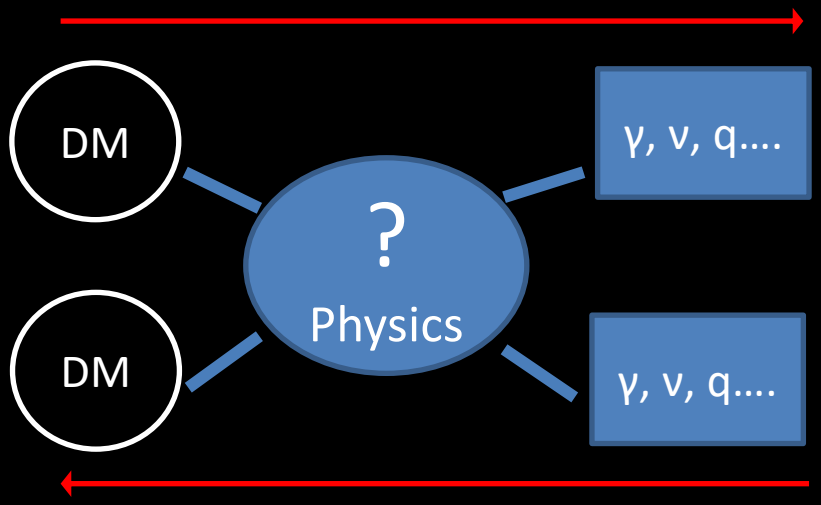
Neutrinos could help understand the gamma rays Tang et al 2018

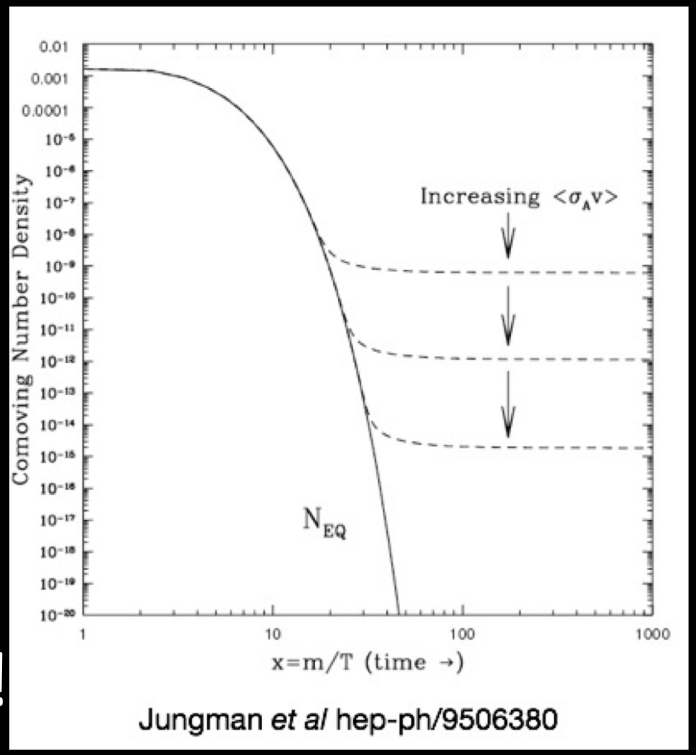
- Time variation
- Hard spectrum
- Large flux

Dark Matter and New physics

Dark Matter

- Weakly Interacting Massive Particles (WIMPs)

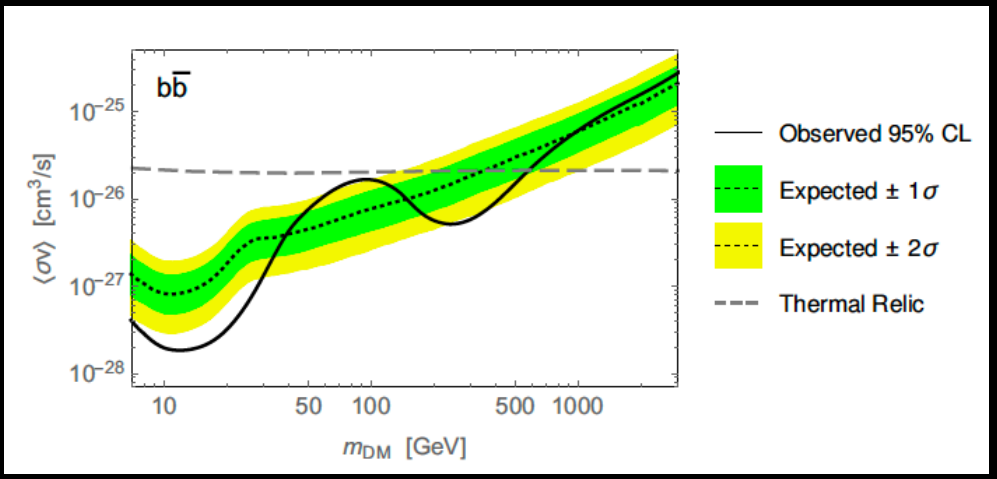




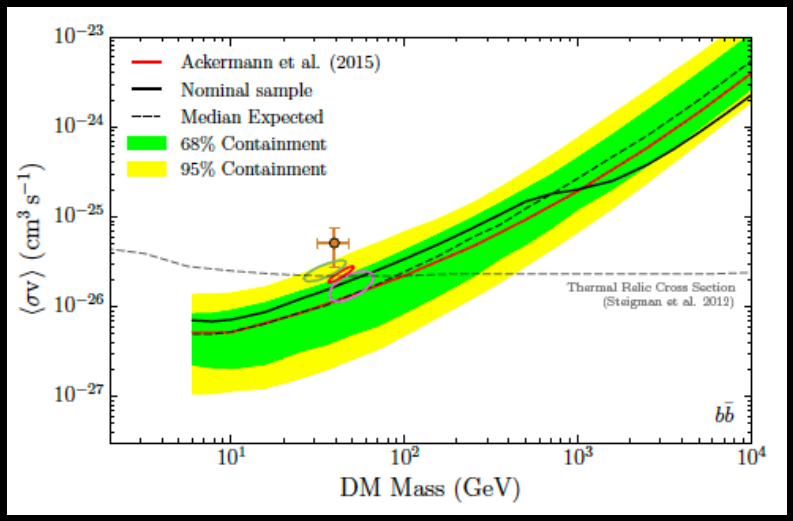
- Abundance <-> ***Total*** Cross section!
- $\frac{\Omega_{DM}\, h^2}{0.1} \approx \frac{3\times10^{-26}\mathrm{cm}^3\mathrm{s}^{-1}}{<\sigma v>}$

Dark Matter Annihilation

Antiproton, Reinert & Winkler 2018



Gamma rays, Fermi collab. 2017



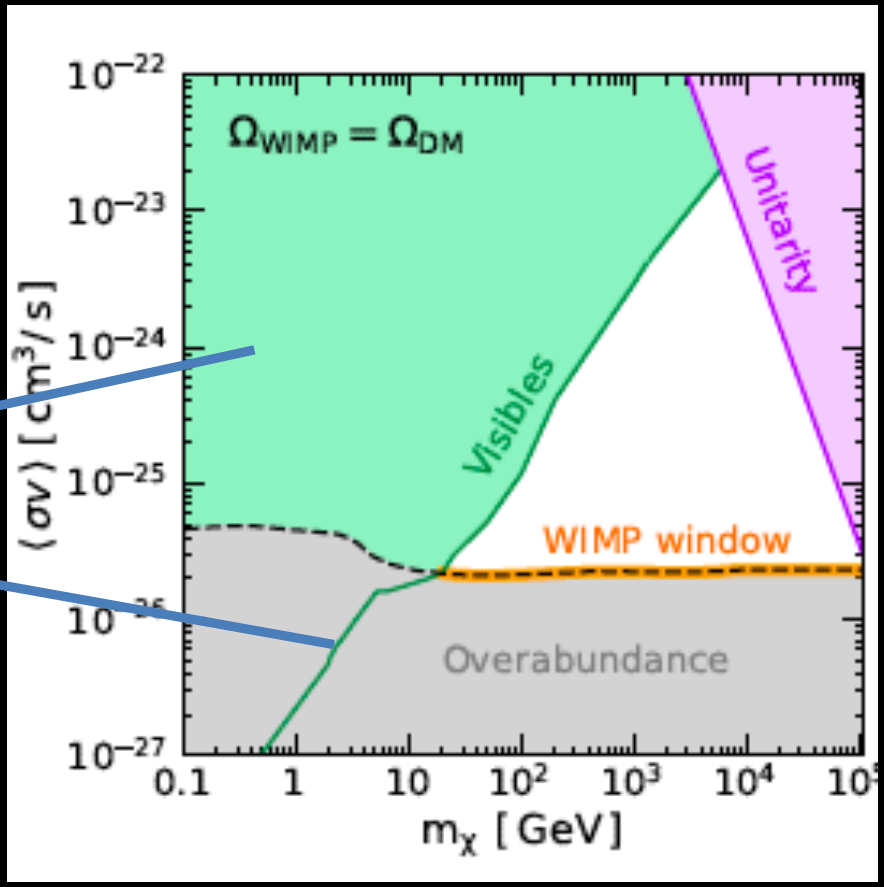
- Specific channels or models

The simplest WIMP hypothesis

- Total cross section constraint
  - Arbitrary, mixed channel (mixed spectrum)
  - Fermi dwarf, AMS positron, Planck CMB
- New physics for large xsec
- Sub DM thermal relics

- All visible channels except Neutrinos!

Leane, Slatyer, Beacom, KCYN, 2018



Neutrino Channel

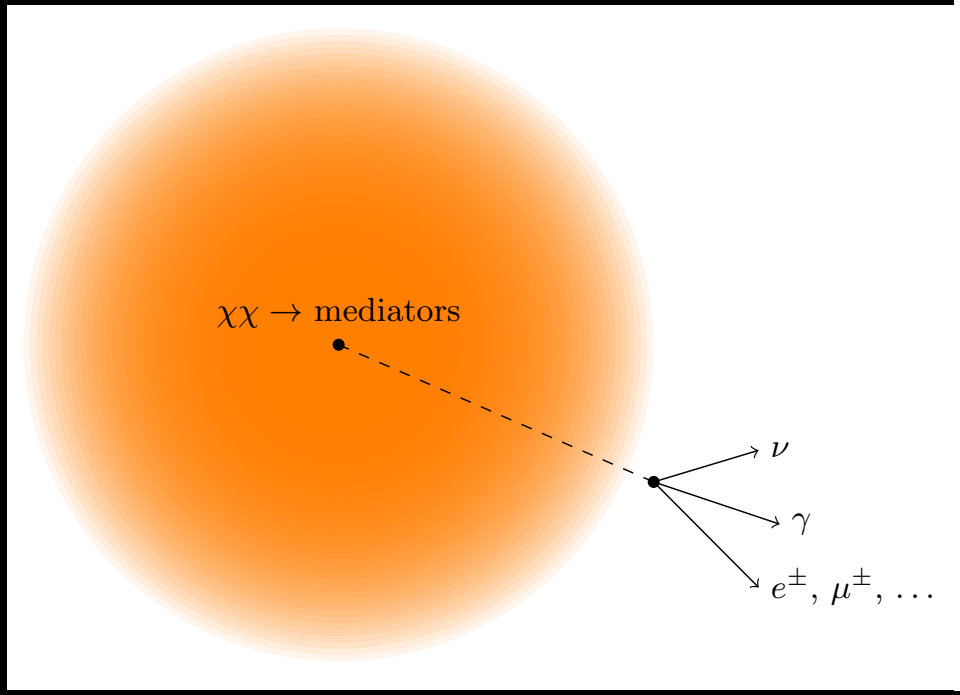
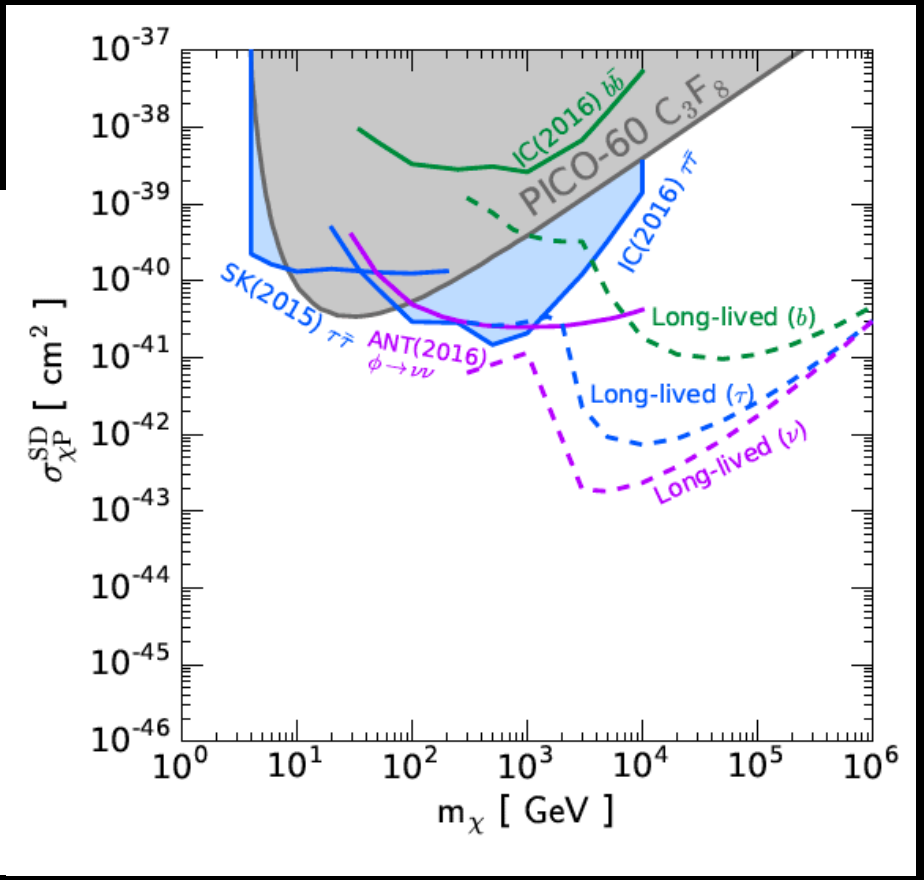
Dark Matter with long-lived mediators

Leane, KCYN, Beacom 1703.04629

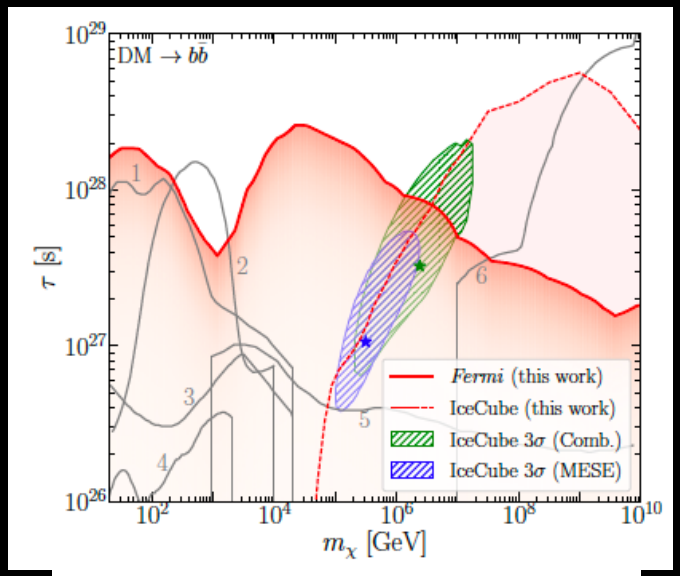
- No neutrino absorption
- + EM signatures!



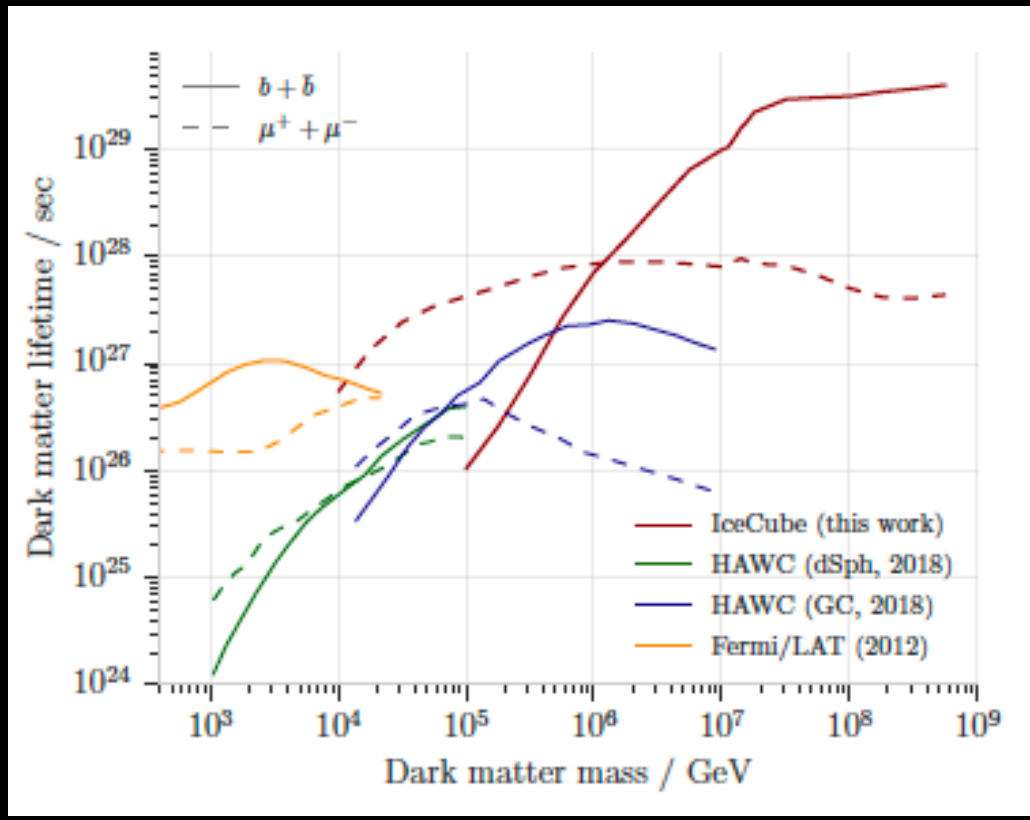


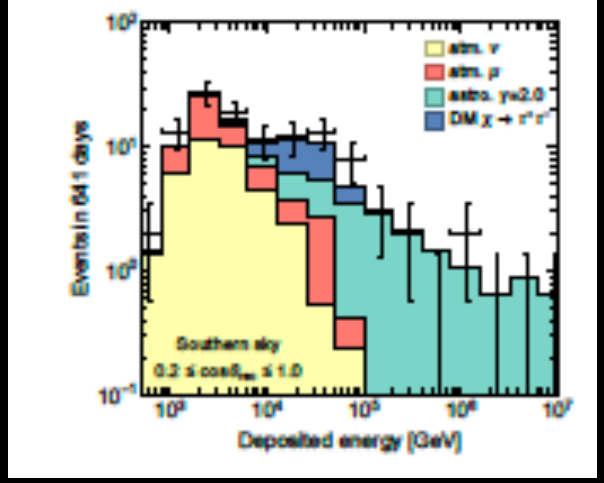
Dark Matter Decay

Cohen, Murase, Rodd, Safdi, Soreq 2017



IceCube Collab, 2018



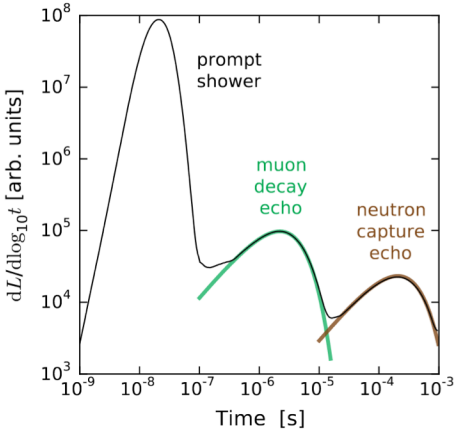


Chianese, Miele, Morisi 2017

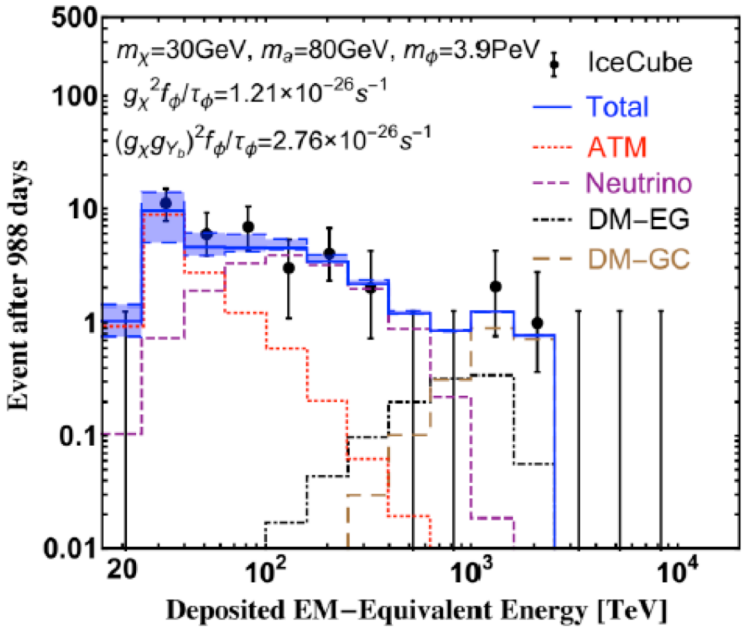
IceCube Boosted Dark Matter

Following search proposed by Kopp, Liu, Wan (2015)

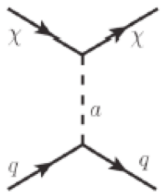
using "Echo Technique" Li, Bustamante, Beacom (2016)

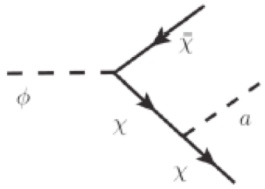


Neutrons capture on hydrogen and product 2.2MeV gamma. In seawater, 33% of neutrons capture on Cl; the emitted gamma rays have 8.6 MeV, making the neutron echoes more visible



Very heavy dark matter particle ϕ decays to lighter stable dark matter χ →boost!





Recoil (only hadronic cascades)

$\phi \to \chi\,\bar{\chi}\,a$, $a \to b\,\bar{b}$ →ν's

"Echo Technique" holds prospects to individually tag high-energy NC and CC interactions !

May sound crazy, but is just an example for exotic interactions in IceCube detectable via recoil

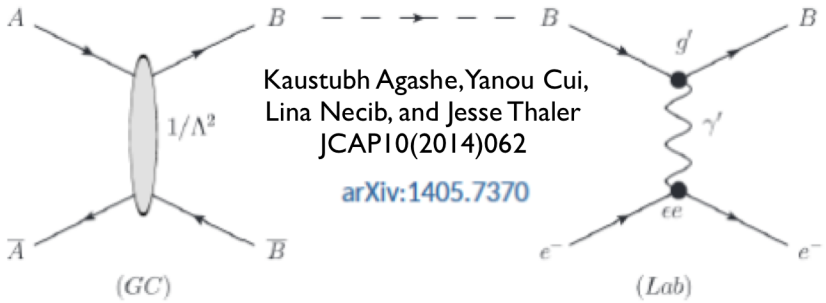
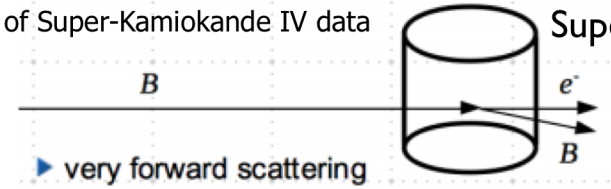
Super-K Boosted Dark Matter



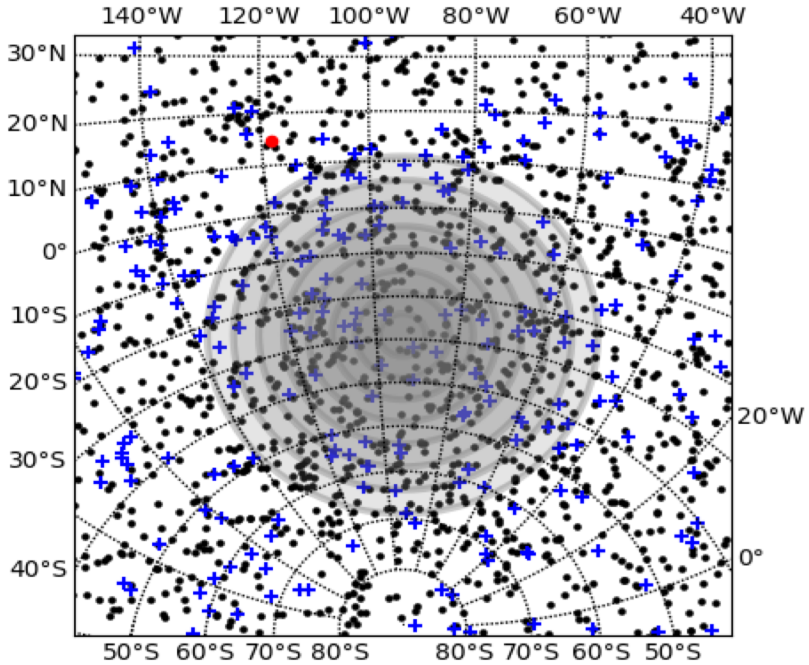
Kaustubh Agashe, Yanou Cui, Lina Necib, and Jesse Thaler
JCAP10(2014)062
arXiv:1405.7370

161.9 kiloton-years of Super-Kamiokande IV data

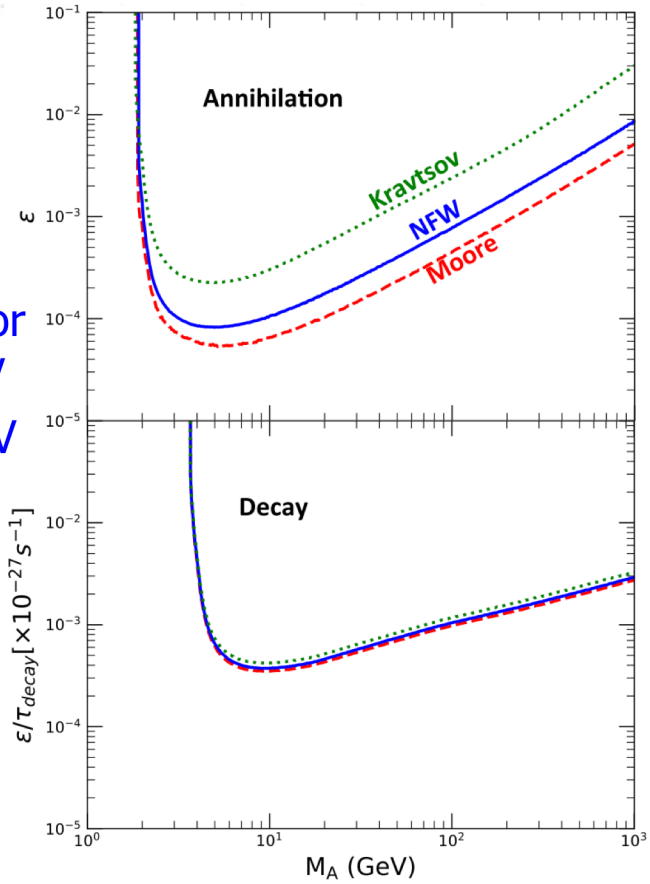


- very forward scattering
- electromagnetic shower
- no hadrons → no decay e, no neutrons

Cone search: 8 cones from 5° to 40° around GC
➔ no cluster found around Galactic Center



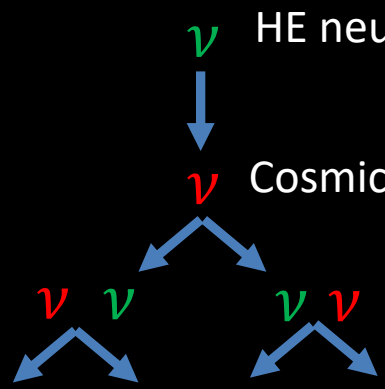
90% limits for
$m_{\gamma'}$=20 MeV
m_B=200 MeV
g'=0.5

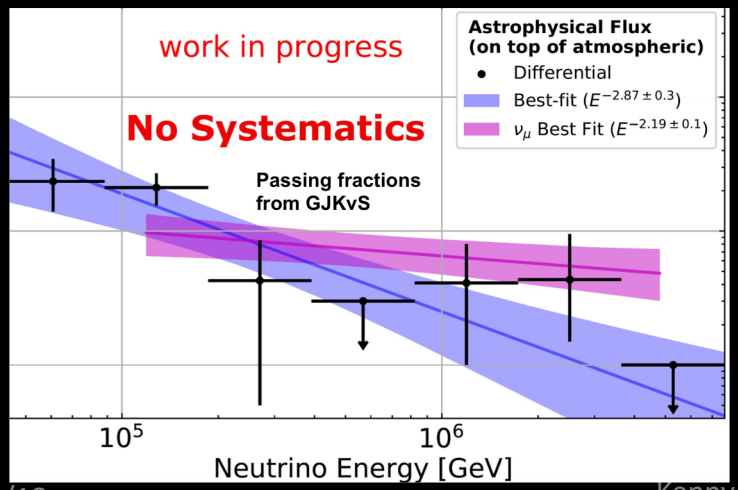


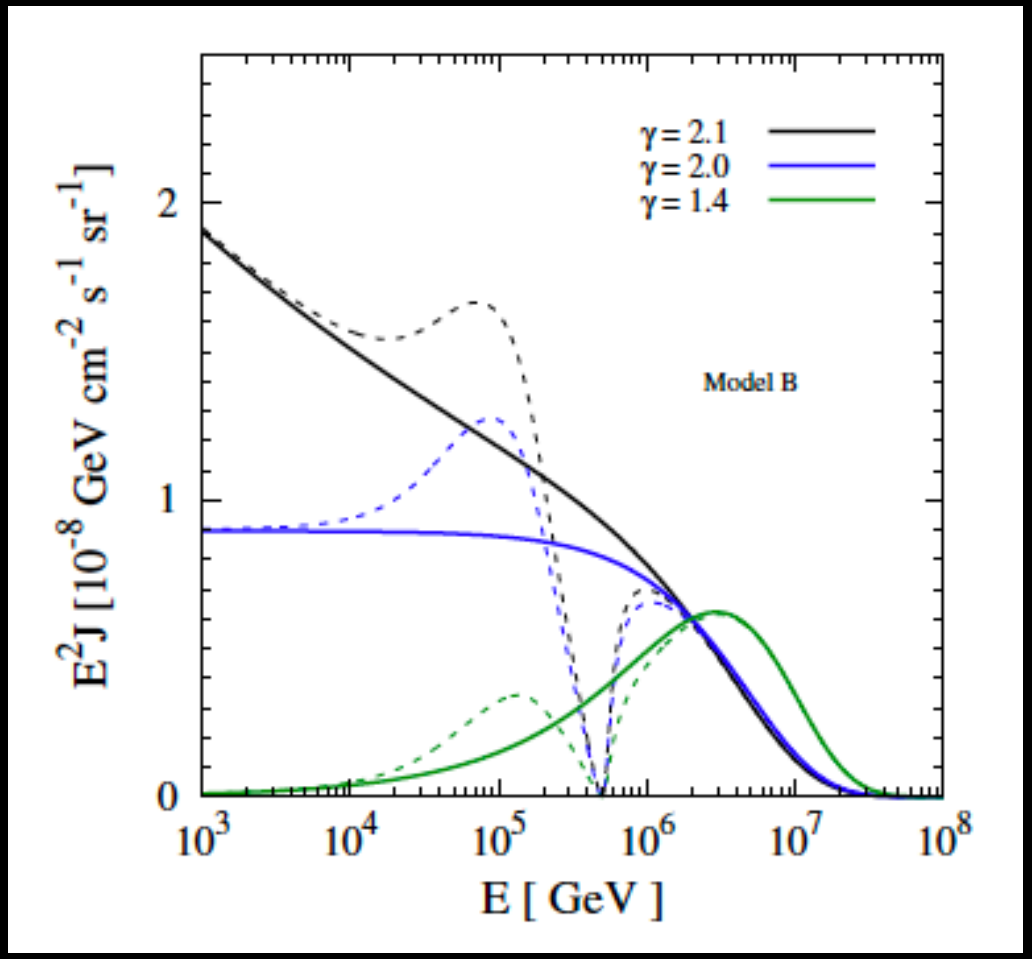
• < 1.33 GeV + 1.33 GeV-20 GeV • >20 GeV

Cosmic neutrino cascades

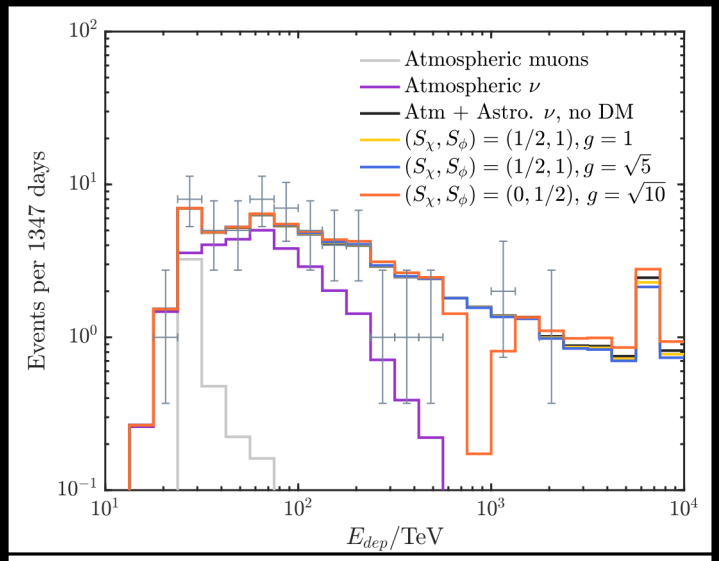
- Secret neutrino interactions

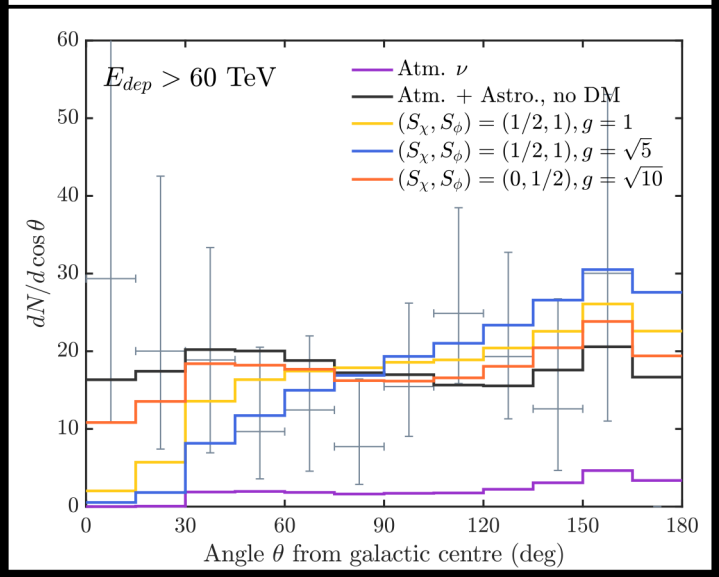


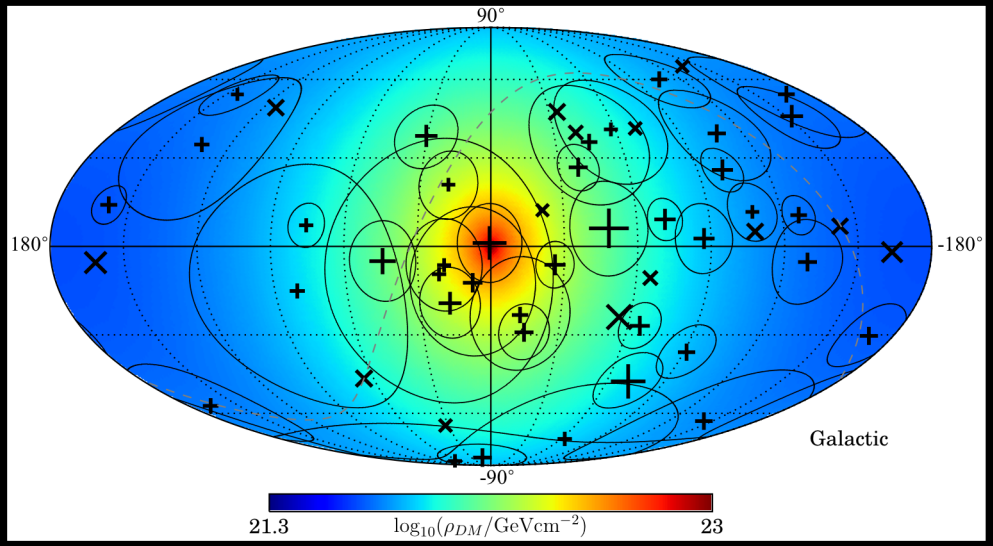




Neutrino Dark Matter Interaction

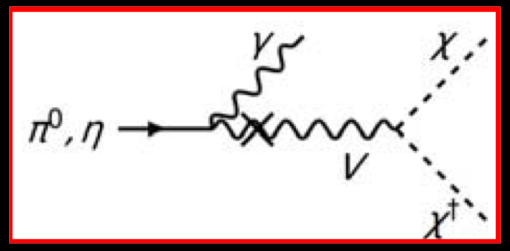


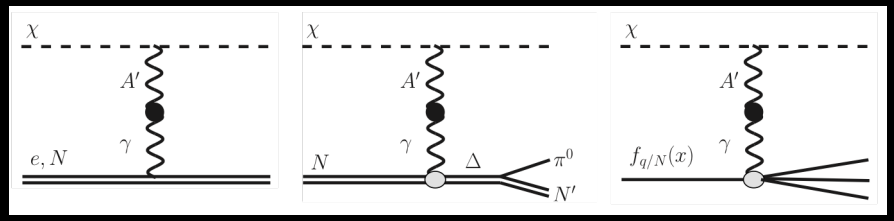


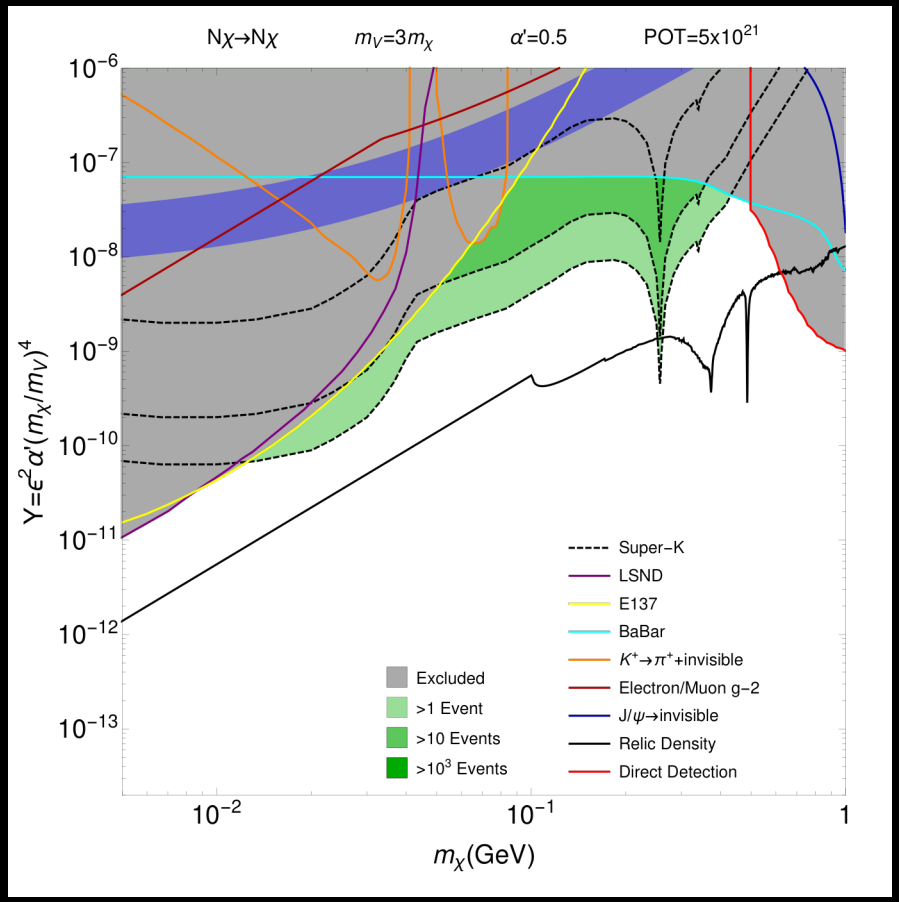


Argüelles, Kheirandish , Vincent, 2017

Dark Matter Beam (T2K)







deNiverville et al, 2017

Summary

- Rich astroparticle phyiscs, many can only be done with water Cherenkov detectors

- Exciting times ahead for new detectors and maybe new techniques

Thanks!
