

## 2nd International Workshop on Machine Learning and Quantum Computing Applications in Medicine and Physics

Contribution ID : 24

Type : **Talk**

### **Quantum Neural Networks: current status and next steps**

*Thursday, 6 June 2024 13:30 (25)*

Classical machine learning has proven valuable since its implementation on classical computers became feasible. On the other hand, quantum computation claims to present an exponential advantage over any classical algorithm for specialized tasks. Thus, adapting the machine learning paradigm to the quantum realm is a promising way forward.

We start the talk with a general introduction to the mathematical framework required for this adaptation. These basic notions are crucial to understanding how we can manipulate quantum systems and what the limitations are. Afterward, we discuss different approaches to “quantizing” the neural network architecture, i.e., adapting classical neural networks to quantum systems, before focusing on Dissipative Quantum Neural Networks. We show that this ansatz has the potential to be a “quantum universal approximator” as it can be used to learn any quantum operation. Lastly, preliminary numerical results and possible next steps are discussed.

**Primary author(s) :** Mr SUTTER, Tobias Christoph (University of Vienna)

**Co-author(s) :** Prof. HIESMAYR, Beatrix (University of Vienna)

**Presenter(s) :** Mr SUTTER, Tobias Christoph (University of Vienna)

**Session Classification :** Quantum computing and machine learning

**Track Classification :** Quantum algorithms and methods
